MIDLAND[™]
GARAGE DOOR MFG CO

Not All Garage Doors Are Created Equal

Where Is The Proof?

The infrared images below show a side-by-side comparison of a Midland ThermoGuard™ door, next to a competitor's polyurethane door. This was observed with the doors installed next to the other in the same location. The outside temperature was 0°F and the inside temperature was 55°F. The dark areas show where energy loss occurs.

Why Do Midland ThermoGuard™ Doors Perform Better?

- 1

True Thermal Break

Midland door sections utilize a true thermal break that minimizes energy loss between sections
- 2

Superior Fit

Midland door sections have tighter and more consistent section gaps
- 3

Structural Rigidity

Concealed full-height vertical center stiles and tailor-made custom end stiles provide structural rigidity
- 4

Minimal Air Infiltration

A flexible commercial-grade seal between the door sections minimizes air infiltration
- 5

Moisture Resistant

Closed cell end dams help to keep moisture away from insulation
- 6

Quality Steel

Hot dipped galvanized steel, that is conditioned and embossed with a pebble texture for maximum durability

Design Options

Why U-Factor Matters

The Key to Better Energy Efficiency

R-Value measures the resistance of a material, U-Factor measures how much heat moves through the entire installed door system. When comparing garage doors, U-Factor gives a more comprehensive picture of the real-world thermal performance

Protect Your Home From Extreme Weather

Wind-rated doors are required by building codes across the country, and are increasingly in demand as consumers recognize the benefits and protection wind rated doors can provide to their home. Midland WindGuard doors are designed and tested to exceed building code requirements and withstand extreme wind events. Visit your local dealer for details.

Illustration for conceptual purposes only. Does not represent an actual Midland Garage Door product or construction.

	U-FACTOR	R-VALUE
What's Measured	How much heat escapes through your garage door	How well the insulation keeps heat from passing through
What Does It Tell You?	How well the entire garage door keeps heat inside	Calculates how the insulation helps prevent heat loss
Testing Standards	Third party testing with strict guidelines and inspection	Unregulated with no standard guidelines
What's Included?	The entire garage door, including panels, joints, and edges	Small section is tested and used for resistance calculation
Which is Better?	Lower is better. Less heat escapes through your garage door	Higher is better. The insulation does a better job resisting heat loss
When Is It Most Useful?	When comparing the overall energy efficiency of garage doors	When comparing the insulation used inside garage doors
What Homeowners Should Know	Complete picture of how energy-efficient your garage door is	R-value but doesn't mean a more energy-efficient door overall
Verified By DASMA		

THERMAL PERFORMANCE VERIFICATION PROGRAM

Is a program to certify and verify the thermal performance ratings of sectional doors. Products included in this program will have a badge, label or icon.

VERIFY LOCAL BUILDING CODES

States, cities and counties have different jurisdictions with different building codes, always check with local building officials

STORM PRESSURES

Storms generate both positive and negative pressures on a garage door. Positive pressures try to push the garage door in, while negative pressures try to pull the garage door out

NON-RATED DOOR RISKS

High winds can cause un-reinforced garage doors to buckle and come out of their tracks, which can lead to a buildup of pressure that damages the roof and supporting walls

WIND RATING STANDARDS

Wind speeds are defined by the International Building Code. Wind pressures include wind speed and other factors like building height, door area, building location, risk category, and exposure category

STRUCTURAL PROTECTION

A wind rated door's purpose is to remain operable after a high wind event so occupants can escape. It also offers protection by reducing the chance of high internal wind pressures from tearing structures apart
